SOP-HPLC-004 HPLC Operation and Troubleshooting

1. Purpose and Scope
This procedure describes the start-up, routine operation and first-line troubleshooting of the analytical HPLC syst

2. Safety
Wear safety glasses, a lab coat and nitrile gloves. Mobile phases containing acetonitrile or methanol are flammal

3. System Start-up

Degas all mobile phases by sonication for 10 minutes or use the inline degasser. Filter aqueous buffers through

4. Troubleshooting High Back-Pressure (Error E-104)
Error E-104 indicates that system pressure exceeded the upper pressure limit of 400 bar and the pump stopped.

5. Baseline Noise and Drift
Excessive baseline noise usually indicates air bubbles in the detector flow cell or a failing lamp. Purge the pump,

6. Shutdown and Column Storage

At the end of the day flush buffer-containing columns with 10 column volumes of 10% methanol in water, then st
